Course objectives

1. To analyze ethical, societal, environmental and sustainability aspects of computer science and engineering
2. To learn the principles of social ethics to practice them in professional and personal lives
3. To become equipped with imperative ethical skills which will help them in their future careers

Ground rules

- Respect for other
- Critique ideas, not people
- Active listening
- Speak from personal experience
- Commit to learning, not debating
- Confidentiality
- Embrace discomfort and 'brave space'
- Support arguments with evidence
- Give and take airtime
- Acknowledge and address harm

1. Understanding Ethics

- Ethics is the **systematic study** of what is morally right and wrong, good and bad, fair and unfair.
- It provides principles to guide human behavior, social interaction, and professional practice.
- In the academic journey—especially in sociology and engineering—ethics helps students understand:
 - How decisions impact individuals and society
 - What responsibilities professionals carry
 - Why moral reasoning matters in modern life
 - How social norms shape our sense of right and wrong

Ethics

1.2 Why Ethics Matters in CSE?

Computer Science and Engineering (CSE) shapes nearly **every sector** — education, communication, health, finance, public governance, surveillance, and even war. With this enormous influence comes **responsibility**.

Ethical literacy helps future engineers:

- Understand the **societal impact** of their work
- Identify **harms and unintended consequences**
- Make **decisions** that protect people, organizations, and the environment
- Build **public trust** in technology

Thus, ethics is not 'optional'- it is **core** to the identity of a responsible engineer.

2.1 Data Privacy and Surveillance

- Unauthorized data collection
- Surveillance systems and digital monitoring
- Misuse of personal information by companies or governments
- Data breaches due to poor security practices

What data should be collected? How long should it be stored?
Who owns the data?

2.2 Cyber-security and Responsible Security Practices

Ethical problems in penetration testing: Prior consent, misleading asking, confidentiality and personal security

Handling of zero-day vulnerabilities: Proactive and multilayer prevention, prompt mitigation, close monitoring

Ethical vs. malicious hacking: White Hat VS Black Hat, Authorized and unauthorized investigation, legal VS illegal plan of action

Responsibilities of engineers when they discover security flaws: Prompt response, remediation and mitigation, protect person and assets

CSE students must understand the duty to prevent foreseeable harm by designing secure, robust systems.

2.3 Social Media Ethics

Spread of harmful content
Manipulation through algorithms
Echo chambers and polarization
Data harvesting for targeted advertising

2.4 Artificial Intelligence and Algorithmic Fairness

2.5 Intellectual Property and Software Piracy

- Ownership of code
- Open-source vs. proprietary conflicts
- Plagiarism in academic or professional coding
- Patents and licensing issues

2.6 Environmental and Sustainability Concerns

High energy consumption of data centers and block-chain

E-waste generated from rapid hardware obsolescence

Sustainable software practices

2.7 Workplace and Professional Ethics

- Conflicts of interest
- Whistleblowing dilemmas
- Ethical responsibilities during product development
- Handling pressure from employers or clients to behave unethically
